Default Rate by Grade

AVG Default Rate by grade

PORTFOLIO RISK

Where Risk Concentrates

Grade G defaults 11.4x more than Grade A

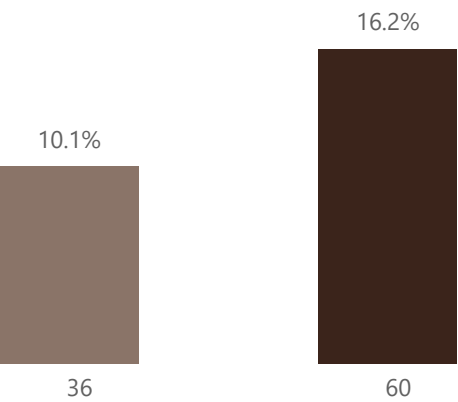

37.5%

Grade G loans default at 37.5%, versus just 3.3% for Grade A. Risk climbs steadily across every grade in between, and the riskiest tiers carry outsized loss potential relative to their share of the book.

RISK METRIC

Risk Trend Over Time

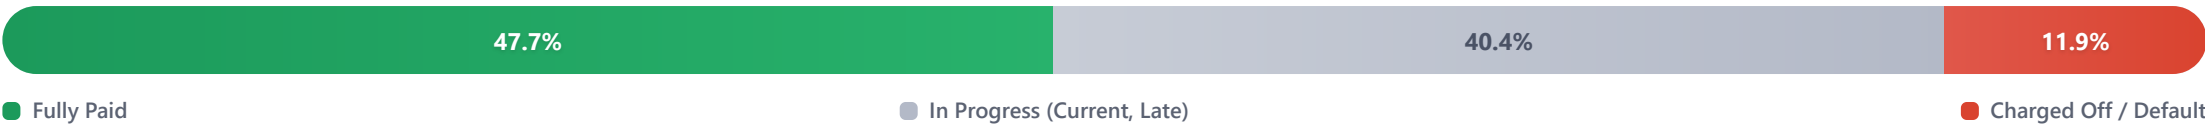

Yearly portfolio view

▼ 77.2% 7.8% → 1.8% (2007 — 2018)

⚠ 2017–2018 appear artificially low. Loans issued that recently have not had time to default — treat the drop as unmaturing data, not improving risk.

LOAN OUTCOME SPLIT · ALL 2,260,639 LOANS

Today's 11.9% charged-off share is a floor, not final: 40.4% of loans are still In Progress and yet to mature.

SMALL BUSINESS loans default most often (19.1%), but **DEBT CONSOLIDATION** carries 52x more loan volume at 13.1% default — the bigger portfolio risk in dollar terms.

BORROWER PROFILE

Who's Borrowing

Average credit history across the book

16.4 yrs

That's the average age of a borrower's credit file at the time of the loan — more years on file generally means more data for underwriting, but individual grade and income still vary widely around that average.

How to read this map

Each state is shaded by its **average loan default rate**. Lighter shades mark states where borrowers default **less often**; darker shades mark states where defaults are **more common**. Color intensity alone tells the story — no two states are compared side by side here, each one simply reflects where it sits on the same scale.

Lower default rate Higher default rate

Hover over any state on the map to see its exact default rate.
